Coffee Shop Sales Business Insights

Analysis period: January–June 2023 | Dataset: 149,116 transactions | Currency: USD

Project overview

This report summarises the main patterns found in the coffee shop sales dataset. The analysis focuses on revenue, transaction activity, product categories, store performance and trading hours. The aim is to turn the figures into practical questions and actions for a store manager.

TOTAL REVENUE	UNITS SOLD	TRANSACTIONS	AVG. REVENUE / TXN
$698,812.33	**214,470**	**149,116**	**$4.69**

1. Revenue trend

Revenue increased from **$81,677.74 in January** to **$166,485.88 in June**, a rise of approximately 104%. June was the strongest month, while February was the only month with a month-over-month decline. The overall direction is positive, but the reason for the growth cannot be established from this dataset alone.

Month	Revenue (USD)
January	$81,677.74
February	$76,145.19
March	$98,834.68
April	$118,941.08
May	$156,727.76
June	$166,485.88

What this could mean

The business should check whether the increase came from more transactions, higher average order value, price changes, product mix or seasonal demand. Comparing these measures month by month would help explain what is driving growth rather than treating revenue growth as the full story.

2. Store performance

Revenue was distributed fairly evenly across the three locations. Hell's Kitchen generated **$236,511.17 (33.8%)**, Astoria generated **$232,243.91 (33.2%)**, and Lower Manhattan generated **$230,057.25 (32.9%)**. The difference between the highest- and lowest-revenue stores was only **$6,453.92**. No location dominates overall sales.

Suggested action: Compare store-level transactions, average transaction value and hourly sales before reallocating staff or inventory. Revenue alone does not show whether one store is more profitable.

3. Product category mix

Coffee contributed **$269,952.45 (38.6%)** of revenue and tea contributed **$196,405.95 (28.1%)**. Together, they accounted for approximately **66.7%** of total revenue. Bakery contributed $82,315.64 (11.8%), Drinking Chocolate

$72,416.00 (10.4%), and Coffee beans $40,085.25 (5.7%).

Category	Revenue (USD)	Share
Coffee	$269,952.45	38.6%
Tea	$196,405.95	28.1%
Bakery	$82,315.64	11.8%
Drinking Chocolate	$72,416.00	10.4%
Coffee beans	$40,085.25	5.7%

Suggested action: Keep coffee and tea availability reliable, then review category-level units and average selling price. Lower-revenue categories may still be valuable if they have stronger margins, but cost data is needed to assess that.

4. Peak trading hours

Revenue was strongest during the morning. The 10 AM hour recorded the highest revenue at **$88,673.39**, followed by 9 AM ($85,169.53) and 8 AM ($82,699.87). The 7 AM–11 AM period accounted for approximately **52.4%** of total revenue.

Hour	Revenue (USD)
7 AM	$63,526.47
8 AM	$82,699.87
9 AM	$85,169.53
10 AM	$88,673.39
11 AM	$46,319.14

Suggested action: Review staffing, food preparation and replenishment around the morning peak. Use store-specific hourly patterns before applying the same staffing plan to every location.

5. Day-of-week pattern

Monday recorded the highest daily revenue at **$101,677.28**, narrowly ahead of Friday at $101,373.00. Saturday was lowest at $96,894.48. The difference between the highest and lowest day was relatively small, so weekday performance appears broadly consistent.

Day	Revenue (USD)	Transactions
Monday	$101,677.28	21,643
Friday	$101,373.00	21,701
Thursday	$100,767.78	21,654
Wednesday	$100,313.54	21,310
Tuesday	$99,455.94	21,202
Sunday	$98,330.31	21,096
Saturday	$96,894.48	20,510

6. Top-selling products

By revenue, the leading products were Sustainably Grown Organic Large ($21,151.75), Dark chocolate Large ($21,006.00), Latte Regular ($19,112.25), Cappuccino Large ($17,641.75), and Morning Sunrise Chai Large ($17,384.00). By quantity, Earl Grey Regular led with 4,708 units, followed by Dark chocolate Large (4,668) and Morning Sunrise Chai Regular (4,643). The top revenue products are not exactly the same as the top quantity

products, which shows why both measures are useful.

Suggested action: Review product availability and menu placement for high-performing items. Use both revenue and quantity when planning stock; do not assume the highest-revenue item is the most frequently ordered.

7. Recommendations

1. Investigate the drivers of monthly growth by comparing transaction count and average transaction value.

2. Use hourly sales by store to plan staffing and product preparation around the morning peak.

3. Maintain availability of core coffee and tea products while reviewing the performance of smaller categories.

4. Track both revenue and units sold when deciding which products need more shelf or menu visibility.

5. Add cost, waste, discount and operating-expense data in a future analysis to assess profitability.

8. Data limitations

The dataset contains sales information but does not include product costs, store operating expenses, customer identifiers, discounts, refunds, inventory levels or staffing information. As a result, this analysis measures revenue and sales activity, not profit, customer retention, promotion effectiveness, stockout rates or staff productivity. The recommendations should be treated as areas to investigate, not proof of cause and effect.

Prepared as part of an Excel data analysis portfolio project. Figures are based on the supplied dataset and may vary if the source data or calculation definitions are changed.
